

ABSTRACT OF THE DISCLOSURE

A portable kiln is transported to a site of logging where there is significant wood waste. At the site, wood waste is collected. The portable kiln is assembled as it is being loaded with wood waste. Once the portable kiln is assembled it is lit with all air intakes open. When combustion is complete and charring begins, some of the air intakes are closed. When charring ends, all of the air intakes and exhausts are closed to permit the kiln to cool down.
